

Decision tree: What the reader still needs

What can the reader
not determine
from the map?

how big or what
shape things are

coord_sf(crs =)

use equal-area for area comparisons and
conformal for outlines, and name it in the caption

where in the world
the study area is

inset_element()

a locator map built from `st_bbox()` and
`st_as_sf()`, drawn with `theme_void()`

which feature
is which

geom_sf_text()

positions from `st_point_on_surface()`, labeling only
the features needed by the text

whether two variables
go together

aes(size =) on a second layer

`scale_size_area()` anchors zero at zero size
use separate maps unless shared space is needed
