

Workflow: The parts of an app

AT THE TOP OF THE FILE

attach the packages; read the data once

paths are relative to the app's folder, which carries its data with it

then

THE INTERFACE

page_sidebar() sidebar() card()

selectInput() filled with set_names() from the data;
actionButton() for an event, downloadButton() for a file;
tmapOutput() and tableOutput() where results go

then

THE SERVER

reactive() chained; eventReactive() for the button

each expression reads the one before it, and only the expressions that read what changed re-run

then

THE OUTPUTS

renderTmap() renderTable() downloadHandler()

the drawing and nothing else; the handler's content function writes to the path Shiny supplies

then

TEST, THEN DEPLOY

testServer() rsconnect::deployApp()

check the reactive expressions without a browser;
deploy the folder, with everything the app reads inside it
